

The Dobsonian telescope is the most popular beginner telescope being sold today, and with good reason. It is the easiest to operate, and provides some of the best views for the least amount of time, effort, and money of any telescope style being currently made. They are available from virtually any telescope retailer online or in store and can be seen at almost any astronomy club.

Although one of the easiest types of telescopes to use, it still offers a lot of capabilities and options which are never explained in the paperwork included with it, assuming there is any paperwork at all. Videos online and forums will only get you so far and can be time consuming and frustrating to find.

This book endeavors to put all the information you will need to stop spending your time searching for information and start enjoying the night sky with all the incredibly amazing stars, planets, nebulae and more you can see in it.

This book will help you:

- \* Make sure a Dobsonian telescope is right for you
- \* Choose what options, sizes, and accessories you need
- \* Set your telescope up correctly to provide the best views
- \* Take amazing pictures of astronomical objects
- \* Know what upgrades you may want in the future
- \* Pick out eyepieces and filters
- \* And much much more
